

Emulsion Corps VIP O₂

Immediate and long-lasting Oxygenating and Moisturizing action

For sensitive, devitalized and very dehydrated Skin Instants[®].

In the *Stratum corneum*, the outermost layer of the epidermis, three entities participate in maintaining good skin hydration: inter-corneocyte lipids whose hydrophobic properties reduce Insensible Water Loss, Natural Moisturizing Factors (NMF) which “fix” water thanks to their hygroscopic properties or via chemical bonds, and lastly the protective hydrolipidic film. A mixture of sebum and water, this film acts as an external barrier to retain water in the skin, thereby keeping it supple. It also helps fight harmful micro-organisms.

The skin’s ecoflora also helps maintain good skin health and hydration. This specific flora is also essential for the structural and functional integrity of the skin. Its presence prevents colonization of the skin by bad bacteria and helps strengthen the immune system. It also secretes molecules (acids and lipases) that counteract or limit the development of other micro-organisms.

Nevertheless, on a daily basis, the skin is the victim of many aggressions: In winter, **cold**, by slowing the functioning of the sebaceous glands, reduces the secretion of sebum and the formation of the protective hydrolipidic film. It also causes dermal blood vessels to constrict, reducing blood flow and the amount of blood-borne water. This disrupts the supply of dermal water, thereby reducing the water reserve it forms for the epidermis.

Furthermore, **the drier the air**, the more water evaporates. Combined with a diminished hydrolipidic film and the restricted dermal water diffusion, these factors explain how skin dries out.

Cleaning products can also be responsible for the deterioration of the hydrolipidic film. They denature surface proteins and strip away the outermost layer of the *Stratum corneum*, taking with it the skin’s flora, thereby encouraging the proliferation of pathogenic micro-organisms that cause various diseases, infections or irritations.

With age, the water content of the corneal layer falls from 13% to 7%, and the sebaceous glands become less active.

Lastly, **exposure to UVB and UVA** damages DNA in various ways, causing thinning of the skin, visible wrinkles, skin dryness, uneven pigmentation, and degradation of collagen fibers and elastin, all signs of skin aging.

The Biologique Recherche response:

To meet the specific problems of sensitive, devitalized and very dehydrated Skin Instants[®], Biologique Recherche has developed an oxygenating and long-lasting moisturizing emulsion for the body: Emulsion Corps VIP O₂ Presented in a spray bottle for easy application, its light, non-sticky, flowing texture penetrates fast.

A long-lasting moisturizing treatment

After all these aggressions, the skin needs repair, moisturization and protection. The hydrolipidic film has to be restored to be able to fully perform its protective function. The skin's flora has to be stimulated to actively fight pathogens. Cells need to be protected and repaired, after UV aggression.

By offering immediate and long-lasting hydration, the Emulsion Corps VIP O₂ formula meets all these needs. Its protective agents strengthen the hydrolipidic film and stimulate the growth of micro-organism flora living on the surface of the skin, displacing pathogenic flora. The skin is able to better defend itself against aggression.

Its soothing properties act immediately on the skin, reducing tightness and discomfort.

Last but not least, its oxygenating and anti-radical agents stimulate cell respiration, fight free radicals and boost the repair of skin cell DNA, thus helping fight premature aging.

Actions:

- Moisturizes immediately and durably the outermost layers of the epidermis
- Protects the skin from external aggression
- Soothes irritation and itching
- Stimulates the skin's natural defences
- Helps regenerate and repair cells

Results:

- Skin is durably hydrated
- Skin is protected and soothed

Hydrating agents: Hyaluronic Acid Complex, Plant-based Polysaccharide

Soothing agent: Aminoacid Complex

Oxygenating agent: Biologique Recherche Special Oxygenating Complex

Protective agents: Skin-protective Sugar Extracts, Cumaru Oil

Anti-radical agent: Antioxidant Tripeptide

Directions for use :

Apply Emulsion Corps VIP O₂ morning and/or night on the entire body by massaging gently using ascending movements.

Versions:

Retail Version: 150 ml spray bottle

Professional Version: 500 ml pump bottle

Available for sale:

February 2015
